

**WEED  
CONTROL**

**edko**

Weed problems are universal. Weeds choke out desirable grass, decrease visibility on highways, increase storm water drainage and hinder access to work sites. Sure, you could mow or weed eat, but how often would you have to, and would it really get rid of the problem?

When it comes to herbicide, Edko uses tools provided by BASF, Dupont, Dow and Monsanto. By investing in these industry leaders, we are supporting future developments in herbicide management and always providing our customers with a guaranteed solution.

# *We Go Way Back*

Edko got its start in traditional herbicide treatments back in the 60s. Our customers have ranged from individual homeowners to investor-owned utilities, to cities and counties. All of our customers have one thing in common. They have a problem and we have a solution.

It's true – other companies boast the same solution, but there's a reason that we've retained contracts for as long as 40 years and customers that changed contractors in the past have come back. It's our quality of work, our reputation of saying "yes", our customer relationships and most of all, our people.

## Don't Lose Control

Whether you're looking to selectively control out-of-place weeds or you want to completely decimate all plant life in an area, we have a solution.

### Non-selective

If absolute bare ground is your desire, we've got the ticket. In some instances, any presence of vegetation is unwanted, such as a plant site, substation, railroad or a storage yard. Vegetation can decay wood, corrode metal, create refuge for pests or even become a fire hazard. Prevent unnecessary headaches and maintenance by eliminating all that is green.

### Selective

Got specific problems? We've got specific solutions. When it comes to drainage canals, parks, levees, or highway roadsides, vegetation is desired, but not all types. Edko utilizes customized, computer-injection equipment that can target specific weed problems, leaving desired vegetation to flourish. In the end, your turf will almost be as pretty as your budget.

## Prevent an Uprising

Weeds may not be a problem right now, but even the smallest presence of unwanted vegetation can result in a larger problem later in the year. By that time you're not only trying to kill existing weeds, but you also have to deal with keeping your turf alive. So, why not attack the problem at the root?

Our pre-emergent application kills weeds before they become an issue, allowing you to focus on one thing at a time.

## Invasive Tactics

Kudzu. Johnson grass. Water Hyacinth. Giant Salvinia. You name it, we've eradicated it. Invasive plant abatement has been a specialty of ours and we continue to provide government agencies with this service to this day.

We understand the fragility of ecosystems and the importance of maintaining native plant populations. This understanding influences our practices, helping us target invasives without sacrificing desired plants.
